

## **Acknowledgements**

I owe a sincere thank you to the many people who have both directly and indirectly made this work possible.

I gratefully acknowledge the support of National Science Foundation, grant No. CMS-0120827 and NASA Graduate Student Researchers Program, grant No. NGT-8-52909, through NASA Marshall Space Flight Center. Without their financial support this would not be possible.

Many thanks to my advisor, Dr. Daniel J. Inman, and my committee members, Dr. Donald J. Leo and Dr. Gyuhae Park. In addition to your amazing technical expertise, the humor and wit of this group is second to none. Dr. Park deserves special recognition for personally mentoring me on all of my work so far as a masters student. I hope to someday be as excellent as you are.

Thank you to Dr. Mike Tinker, my advisor at NASA, who has been incredibly flexible on the timing of the completion of this thesis and my involvement with the health monitoring projects at the Marshall Space Flight Center.

Thank you to Dr. Tom Paez and Dr. Chuck Farrar of Sandia and Los Alamos National Laboratories who supported the research on the damping of bolted joints, which was done as part of the Los Alamos Dynamics Summer School.

Thanks to my friends in CIMSS, Blacksburg and elsewhere who have entertained me and put up with my complaining as I have worked towards this thesis and degree.

Thank you to my parents and sister who have always encouraged me through their never ending love and support and remind me that even when I do fail it is not the end of the world.
